RESEARCH ACTIVITIES

I am in charge of the experiments in the catalytic and chemical field at APE-HE beamline (Elettra). Moreover I am developing a device for near-edge X-ray absorption fine structure spectroscopy (NEXAFS) at ambient pressure to follow the kinetic of catalysts in operando conditions. My research activity is focusing on the characterization of heterogeneous catalysts to shed of light on the catalytic mechanism. In particular I have studied many types of metal organic framework (MOFs) modified during or the synthesis either during the pretreatment for enhancing their catalytic properties. I am also studying other catalysts based on $\text{Cr}^{\text{VI}}/\text{SiO}_2$, CeO_2 and porous materials as zeolites. The catalytic reactions under investigation are: CO_2 conversion to hydrocarbons, olefin epoxidation, CO oxidation, hydrogenation of hydrocarbons and direct methane to methanol reaction. The technique used for this purpose is mainly X-ray absorption spectroscopy supported by theoretical approach with DFT simulations. However I use also XPS, FTIR and XRD techniques. My experience with synchrotron radiation covers more than 40 experiments (some of them as **main proposer**) at different facilities as ESRF (BM23, ID11, ID20, BM01), Max Lab II (I1011 and I811beamline), PSI (SuperXAS beamline) and Elettra (APE and XAFS beamline).
